General Education Narrative Assignment

1. My current goal, once I graduate, is to work as a web developer. Ideally working with a full stack of web technologies, having to perform tasks on both the front and back end of the system. A long term goal that I have would be to become a project lead/architect, performing design and management work instead of strictly developing.
2. In general I believe the most impactful concept that general education courses taught me was that everything has a cause and effect. I took a lot of history/social science courses for my general elective curriculum, and throughout there were lessons about the causal relationship behind things. This applies to engineering, because you must think about all possible outcomes (effects) and their causes, unless you will build a product that is susceptible to failure.
3. For engineers, general education curriculum is very important because it allows individuals to be able to see the peripheral effects of their work. These effects, whether societal, economical, or global, play a large role in how an engineer should go about developing their solution, as in the end, they will affect how the product turns out.

My General Education Course List:
- ARCH 321
- HIST 327X
- ECON 101
- TSC 220
- POL S 215
